No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 4, Application US/08476900A
Patent No. 6031150
GENERAL INFORMATION:
APPLICANT: JOSEPH Bryan, Lydia Agu
TITLE OF INVENTION: Sequence Encod
Patent No. 6031150
TITLE OF INVENTION: and Method of
TITLE OF INVENTION: Infancy
NUMBER OF SEQUENCES: 49
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              US-08-404-531B-5/C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 14

    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           seq length: 0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published-pct-sequences. The oligonuclectides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an sequence data for this patent did not form part of the sprinted specification, but was obtained in electronic format directly from WIPO at ftp, wipo.int/pub/published-pct-sequences. (Impared in circulty from WIPO at ftp, wipo.int/pub/published-pct-sequences. (Impared in circulty from WIPO at ftp, wipo.int/pub/published-pct-sequences. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 392 BP; 100 A; 105 C; 85 G; 102 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype
                                                                          characteristics.
                                                                                                                                                                                                                                                         Sato

The present invention describes a compound (I) that is 8-50 nucleobases in length: (a) targets a nucleic acid molecule encoding major histocompatibility complex (MHC) class II transactivator, and specifically hybridises with the nucleic acid encoding the MHC class II transactivator, and inhibits the expression of MHC class II transactivator; or (b) specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding MHC class II transactivator. (I) has immunosuppressive, antimicrobial, antidiabetic, antirheumatic, antiarthritic, cytostatic, nootropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; major histocompatibility complex class II transactivator; MMC class II transactivator; antisense modulation; immunosuppressive; antimicrobial; antidiabetic; antixheunatic; antiarthritic; cytostatic; nootropic; neuroprotective; immunostimulant; autoimmune disorder; mMC class II transactivator inhibitor; infection; transactivator inhibitor; infection; transactivator inhibitor; infection; disease; gene; ss. multiple sclerosis; severe combined immunodeficiency disease; gene; ss.

The MHC class II transactivator antisense oligonucleotides can be used for treating an animal having a disease or condition associated with MHC class II transactivator, e.g. autoimmune disorder or infection. The antisense oligonucleotides can be used for inhibiting the expression of MHC class II transactivator in cells or tissues. In particular, these diseases include transplant rejection, diabetes, rheumatoid arthritis, cancer, Alzheimer's disease, multiple sclerosis, or severe combined immunodeficiency disease. The antisense compounds are useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence encodes a human MHC clast II transactivator, which is used in an example from the present invential.

The invention also relates to comprise the compression vectors and host cells comprising a polymorphides. The invention also relates to compression vectors and host cells comprising a polymorphide comprising a polymorphide comprising a polymorphide of the invention; antibodies against polypeptides of the invention; antibodies against polypeptides of the invention; antibodies against polypeptides of the invention; a comprising a polypeptide of the invention; a compression vectors and host cells comprising a compression of the invention; a compression vectors and polypeptides of the invention; a compression of the invention; a composition comprising polypeptides of the invention; antibodies, antibodies, antibodies, antibodies, composition (comprising polypeptides, or complete the polypeptides, or composition proteins, T cells prepared compression; a method and kit for detecting or determining the presence or absence of places in a comparison; and a method for inhibiting the development of places in a comparison; and a method for inhibiting the development of places, fusion compression; T cell populations or antigen-presenting cells that express the compression. The polymorphides are useful for diagnosing, preventing or treating acnes comparison. The polymorphides are useful for minute response specific for a places or primers for comparison. The polymorphides can also be used as probes or primers for compression and the kit is useful for performing a diagnostic assay. The present comparison of the invention. Note: The sequence data for this patent did not form the invention and provention, but was obtained in electronic format comparison of the printed specification, but was obtained polymorphic format comparison.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The present invention describes a method (M1) for screening for an anti-
CC neeplastic agent. The method involves exposing cells to a chemical agent
CC to be tested for anti-neoplastic activity, determining a change in
CC expression of at least one gene (I) of a signature gene set, where (I)
CC comprises a sequence (S) selected from 8447 sequences (given in ABL61664
CC to ABL70110), or is at least 95% identical to (S), where a change in
CC expression is indicative of anti-neoplastic activity. (I) has cytostatic
CC activity and can be used in gene therapy. MI can be used for screening an
CC anti-neoplastic agent, and can be used for producing a product which is
CC the data collected with respect to the anti-neoplastic agent as a result
CC of M1, and the data is sufficient to convey the chemical structure and/or
CC properties of the agent. MI can be used in the treatment of cancer such
CC activity and cancer, stomach, lung, thyroid, oesophageal, ovarian, kidney,
CC prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell
CC cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous
CC cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-SEP-2000

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57377-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                      21-APR-2000;

sequences AAS59506-AAS59804 represent DNA molecules encoding Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is constitutions of bone, joints and the central nervous system, however it is constitutions of bone, joints and the central nervous system, however it is constitutions. A method for detecting the presence or absence of P. acnes in a constitution of the invention and determining the amount of bound protein the proteins of the invention and determining the amount of bound protein the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes preteins. These antibodies can be cused to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as called the constitution of the protein state of the protein state of the protein state of the protein state of the protein state of the protein state of the protein state of the protein state of the protein state of the protein state of the printed sequence and the was obtained in electronic format directly from WIPO at content of the printed securities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 349980 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oryza sativa.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           involved in plant resistance or response to pathogenic infection. MI comprises identifying a gene whose expression is significantly altered the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 2000 BP; 336 A; 265 C; 284 G; 363 T;

This invention describes a novel isolated polynucleotide (I) containing CC at least one sequence that (i) is 70% identical with a sequence that CC encodes at least one of 251 amino acid (as). (3) or 108 as (5) CC polypeptides, (ii) encodes a polypeptide at least 70% identical with (3) CC or (5); (iii) is the complement of (i) or (ii), or (iv) contains at least CC 15 consecutive bases from (i)-(iii). The invention also describes (a) CC protein derived from sequences of 753 bp (2) or 324 bp (4); (b) CC coryneform microorganisms, especially Covynebacterium, transformed with CC coryneform microorganisms, especially Covynebacterium, transformed with CC coryneform bacteria in which the CC branched-chain I-aa by fermentation of coryneform bacteria in which the CC branched-chain I-aa by fermentation of coryneform bacteria in which the CC specially overexpressed; and (d) method for isolating the brnB and/or CC especially overexpressed; and (d) method for isolating the brnB and/or CC used for fermentative production of branched-chain amino acids, coryneform bacteria being CC sprebacterium; laucine, isoleucine and valine, which are useful in medicine CC and animal nutrition. (I) can also be used as source of primers and probes for isolation of related sequences. Transformation with (I) CC increases yield of branched-chain amino acids. This sequence encodes the CC corynebacterium glutamicum AFCC 13032 brnF and brnB proteins described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   L-amino acid production; brnF; coryneform bacterium; leucine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ?
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAH21112 standard; DNA; 1271

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel nucleic acid array involving Corynebacterium glutamicum polynucleotides. The arrays are used to corynebacterium glutamicum polynucleotides. The arrays are used to analyse C. glutamicum, particularly for monitoring a fermentation process to determine expression levels of C. glutamicum cellular mRNA. Such monitoring particularly differentiates between expression levels of different different strains of C. glutamicum and allows the adjustment of different culture and fermentation conditions. ACA00010-ACA02188 represent C.

This invention describes a novel isolated polynucleotide (I) containing at least one sequence that (i) is 70% identical with a sequence that (c) encodes at least one of 251 amino acid (aa) (3) or 108 aa (5) cc encodes at least one of 251 amino acid (aa) (3) or 108 aa (5) cc (5); (iii) encodes a polypeptide at least 70% identical with (3) cc (c) (ii); (ii) encodes a polypeptide at least 70% identical with (3) cc (c) (iii) is the complement of (i) or (ii), or (iv) contains at least 15 consecutive bases from (i) (iii). The invention also describes (a) cc (c) protein derived from sequences of 753 bp (2) or 324 bp (4); (b) cc (c) contour microorganisms, especially cyrnebacterium, transformed with (c) one or more (I), where these are replicative DNA; (c) production of coryneform bacteria in which the cc brnE and/or brnF genes (or equivalent sequences) are amplified, cc brnE and/or brnF genes (or equivalent sequences) are amplified, cc especially overexpressed, and (d) method for isolating the brnE and/or brnF genes. (I) is used for transformation of coryneform bacteria being cused for fermentative production of branched-chain amino acids, and animal nutrition. (I) can also be used as source of primers and corynebase for isolation of reaching and sequences encodes the corynebacterium glutamicum, ATCC 14752 brnF and brnE proteins described in corynebacterium glutamicum, ATCC 14752 brnF and brnE proteins described in
                                                                                                                                                                                                                                                                                                                                                       Query Match

(I) is used for transformation of coryneform bacteria being used for fermentative production of branched-chain amino acids, specifically leucine, isoleucine and valine, which are useful in medicine and animal nutrition. (I) can also be used as source of primers and probes for isolation of related sequences. Transformation with (I) increases yield of branched-chain amino acids. This sequence encodes the Corynebacterium glutamicum ATCC 14752 brnB protein described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebatterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium. And identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly 1-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 324 BP;

Ξ

New export genes from coryneform bacteria, useful for increasing fermentative production of branched-chain amino acids.

Claim 5; Page 16; 23pp; German.

This invention describes a novel isolated polynucleotide (I) containing at least one sequence that (i) is 70% identical with a sequence that encodes at least one of 251 amino acid (aa) (3) or 108 aa (5) polypeptides; (ii) encodes a polypeptide at least 70% identical with (3) or (5); (iii) is the complement of (i) or (ii), or (iv) contains at least 15 consecutive bases from (i)-(iii). The invention also describes (a) protein derived from sequences of 753 bp (2) or 324 bp (4); (b) coryneform microorganisms, especially Corynebacterium, transformed with one or more (I), where these are replicative DNA; (c) production of
